

GOLF

Advantage Sports & Leisure can provide the ultimate in synthetic golfing systems resulting from significant technological advancements in the plastics and manufacturing process and extensive research between Prograss and our official development partners Team Sports.

The introduction of the 'helix' yarn system has enabled engineering of the first product specifically designed for golf, providing excellent durability and unsurpassed performance.

SYNTHETIC GRASS

PGS Supergreen

This revolutionary Australian Synthetic turf and underlay technology provides tournament standard chipping and putting performance and is an ideal solution for any situation requiring a premier all-weather surface which looks, feels and plays like natural turf.

PGS Supergreen has the ability to absorb energy and dissipate impact from the ball landing, allowing it to check up and run naturally on the surface.

The feel of the surface and run of the ball is similar to a top class natural grass green.

PGS Supergreen is suitable as a replacement for sand greens, resorts, retirement villages, practice centres, hotel and leisure facilities and private homes.

Advantage Putting Green

To facilitate even play, this putting surface has a short 15mm pile, tufted to be non-directional enabling a more stable surface across the putting green. This product allows for a consistent ball speed across the green and will give the appearance of a natural green.

This synthetic grass is ideal for backyard putting greens or for small commercial use.
