

TENNIS

Advantage Sports & Leisure synthetic grass tennis courts are made to order with integrated line marking in kit format to reduce seaming. Our products are designed to suit all abilities and needs from schools and residential to high-use commercial tennis centres. All our products carry ITF certification and are made to handle the harsh Australian environment.

SYNTHETIC GRASS

Satellite

Satellite is the preferred synthetic grass for residential and medium-wear situations. A 19mm product with a total weight of 2,038gms/m², it is a quality and cost-effective product. Satellite provides a medium-paced surface that responds to the natural spin of the ball and provides additional slide for players on the court.

Challenge

Designed for commercial centres with heavy usage, Challenge has a heavier stitch rate than the standard Satellite product. With a double backing, Challenge provides additional strength and durability. This is the most popular tennis club product having the playing characteristics of Satellite, but with more fibre per square meter providing a heavy density surface.

Pro Tour

With a 15mm pile height, Pro Tour is designed for the serious tennis player. Pro Tour has a proven ratio of polypropylene to sand offering a consistent medium-paced ball bounce and provides excellent stability with controlled slide. Pro Tour responds to all standards of play and exceeds the requirements set for synthetic tennis court surfaces. Because of its very dense construction, it requires less sand infill than the standard 19mm product.

All of the above products have the highest ultraviolet protection available worldwide. They also are guaranteed by the manufacturer for 7 years in accordance with their warranty for Australian conditions.
